Customize Teams with built-in Power Platform capabilities

Teams customers can make and use custom tabs, personal apps, chat bots, and more using a powerful onboard data platform and approachable low-code tools from the Power Platform.

Here's a 3-step quick start guide for building your first app inside Teams.

1. Get Power Apps in Teams

Here's how

Navigate to the Teams App Store, or select "…" in your left rail and search for Power Apps.

Install one of our pre-built, just-for-Teams apps which can be easily extended to fit your needs.

Select Create an app at the top of the Power Apps home screen to build your own app from scratch.

Choose which team will host the app.

2. Create your first table

Here's how

Select Create table on the left hand side of Power Apps to build your first table.
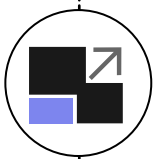

Add columns with specific types — text, numbers, dates, etc. — which will help with app building later.

Create choice columns with a predefined list of options, and lookups that establish relationships to other tables.

Start filling in rows of data in real time, just like you would in Excel, as you're designing your tables and columns.

3. Customize and publish your app

Here's how

Use Power Apps to completely customize the user experience, add additional data sources, and create new screens and workflows.

Preview the app inside the Power Apps studio, make some adjustments to the fields that show up in the form and gallery.

Publish to Teams so others in your team can use it as well.
